## 5th December 2011

Engineers, infrastructure owners and asset managers face growing pressures to complete projects: better knowledge of what lies beyond the surface can improve performance in key areas including safety, programme, environmental impact and cost. Fugro Aperio is running a series of seminars explaining how today's technologies can help you see beyond the surface of buildings and structures.

Find out how an integrated approach to testing and investigation of construction materials can provide a better understanding of your structure; with reduced damage to it and minimal disruption to its users.

Speakers include Dr Michael Gray (over 20 years' experience of construction materials investigation and consultancy) and Simon Brightwell (over 20 years' experience of non-destructive investigation). The session will cover civil

and structural engineering applications including investigation of:

- Defects (cracking, delamination, voiding etc)
- Durability
- Moisture
- Corrosion
- Physical and chemical properties

Construction materials covered will include concrete, masonry and metals.

Case studies will include a range of recent projects highlighting issues such as cost-effectiveness, access requirements, progress rates, accuracy and reliability
